

CONTENTS

Abstract.....	1
Introduction	2
Ground-Water Flow Simulation.....	2
Simulation Flow Boundaries	4
Estimates of Source Contributions	6
Boundary-Flow Budgets.....	6
Simulation-Defined Zone of Contribution for the Independence Well Field	8
Simulation-Defined Zones of Contribution for Individual Wells or Groups of Wells.....	9
Particle-Tracking Analysis	19
Limitations of Estimates.....	20
Chemical and Isotopic Mixing Equation Analyses	22
Estimates of Source Contributions	23
Limitations of Estimates	24
Synopsis of Contribution of the Missouri River to the Independence Well Field.....	27
Summary.....	28
References	30

FIGURES

1. Location of study area and ground-water monitoring well network for the Independence, Missouri, well field.....	3
2. Location of supply wells in the Independence, Missouri, well field.....	5
3. Hydrologic boundaries in the ground-water flow simulation.....	7
4. Simulation-defined zone of contribution for the Independence, Missouri, well field for each layer of the ground-water flow simulation	10
5. Simulation-defined zone of contribution for wells or groups of wells in the Independence, Missouri, well field for each layer of the ground-water flow simulation	15
6. Pathlines of particles between source cells and well cells of the Independence, Missouri, well field.....	20
7. Relative amount of source water to total Independence, Missouri, well-field pumpage as a function of traveltime from the source.....	22
8. $\delta^{18}\text{O}$ and δD values for ground water, combined well-field pumpage, and Missouri River water and the meteoric water line	24
9. Maximum, median, minimum, and quartiles of analyses for common constituents in ground water, well-field pumpage, and Missouri River samples	25
10. Maximum, median, minimum, and quartiles of analyses for $\delta^{18}\text{O}$ and δD in ground water, well-field pumpage, and Missouri River samples.....	26
11. Estimates of the relative amount of Missouri River water in the Independence, Missouri, well-field pumpage and the maximum and minimum error for ground-water simulation and mixing equation methods.....	28

TABLES

1. Pumping rates for supply wells in the Independence, Missouri, well field 6

2. Boundary flow components for the pumping scenario and no-pumping scenario for the Independence, Missouri, well field 8

3. Simulated flow budget for the simulation-defined zone of contribution for the Independence, Missouri, well field 14

4. Flow budgets for individual zones of contribution to individual wells or groups of wells within the Independence, Missouri, well field 35

5. Particle tracking results indicating the relative amounts of source waters to the individual wells and groups of wells within the Independence, Missouri, well field 21

6. Percentage of source water reaching Independence, Missouri, well field zones of contribution within 1, 2, 5, 10, and 25 years, and total simulation time 46

7. Results of analyses for common constituents in water samples from Independence monitoring wells, combined Independence, Missouri, well-field pumpage, and the Missouri River at St. Joseph, Missouri 48

8. Results of analyses for isotopes of oxygen and hydrogen in water samples from the Independence monitoring wells, combined pumpage of the Independence well field, the Missouri River at St. Joseph, Missouri, and the Missouri River near the Independence, Missouri, well field 53

9. Results of mixing equation for common constituents, $\delta^{18}\text{O}$ and δD 26

CONVERSION FACTORS

Multiply	By	To obtain
meter	3.281	feet
cubic meter per day	264.2	million gallon per day
